1. Construction of Aluminium Electrolytic Capacitors

High gain etched anode foil with the thick oxide layer, which is produced by the forming-process, is shown at the top of figure 2. The cathode foil with a much thinner oxide layer is arranged at the bottom. Layers of papers are separating both foils. The electrolyte fills up the pores of the aluminium foils and thus builds either the one electrode of the anode or cathode capacitance. The dielectric consists of the oxide layers of the anode foil respectively the cathode foil. This construction builds two capacitances: the anode and the cathode capacitances. Because of the thicker oxide layer the anode capacitance is normally much smaller than the cathode capacitance.

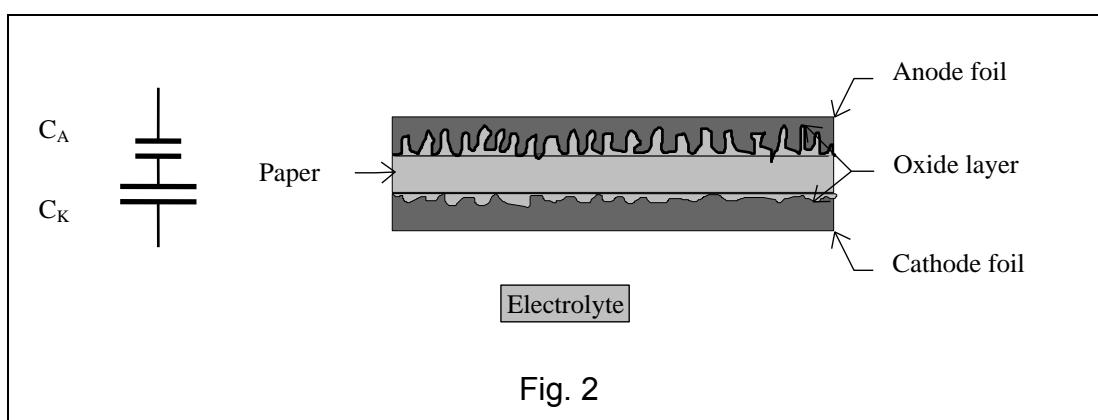

Fig.2 shows a cross section of the winding.

If two capacitors are connected in series, the total capacitance results from the relationship

$$C_G = C_A * C_K / (C_A + C_K)$$

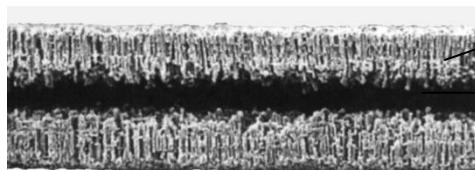

If $C_A \ll C_K$ it follows $C_G \approx C_A$. (aspired normal case)

This means the anode capacitance determines the capacitance of the whole capacitor (the cathode foil decreases the capacitance only somewhat). To accomplish that, highly etched cathode foils are necessary.

Nonpolarized electrolytic capacitors use the same foil for anode and cathode ($C_A = C_K$) Therefore the capacitance of these capacitors are given by $C_G = 0,5 * C_A$.

It is obvious that a nonpolarized electrolytic capacitor needs two times the space of a polarized capacitor.

3. Parameter

3.1 Rated voltage

The rated voltage (U_R) is the voltage the capacitor is designed for. This voltage may be applied continuously to the capacitor over the full temperature range.

3.2 Surge voltage

The Surge voltage may be applied to the capacitors only for a short time.

$U_R \leq 315 \text{ V}$: $U_S = 1,15 * U_R$ (5 times 1 min per hour)

$U_R > 315 \text{ V}$: $U_S = 1,1 * U_R$ (5 times 1 min per hour)

3.3 Ripple voltage

In many applications the voltage applied to capacitors is a combination of direct and alternating voltage. Pay attention to the following points:

- The superposition of AC and DC must not exceed the rated voltage.
- Reverse voltage is not allowed.
- The applied ripple current must not exceed the rated ripple current.

3.4 Maximum reverse voltage

The Aluminium Electrolytic Capacitor is a polar component. Diodes with a max. conducting state voltage of 0.8 V could be used to prevent reverse polarity voltage. Single shorttime reverse polarity of $V < 1.5 \text{ V}$ for $t < 1 \text{ s}$ is tolerated.

3.5 Rated capacitance

The rated capacitance is usually determined at 100 Hz and 20 °C . In general the rated capacitance is marked on the capacitor in μF .

3.6 DC and AC capacitance

The capacitance determined by AC measurements is smaller than the capacitance determined by charge / discharge measurements.

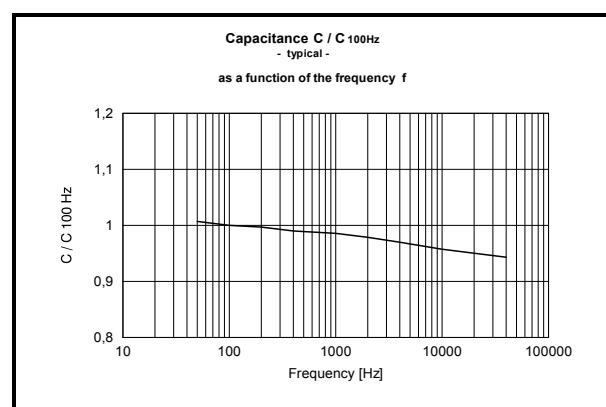

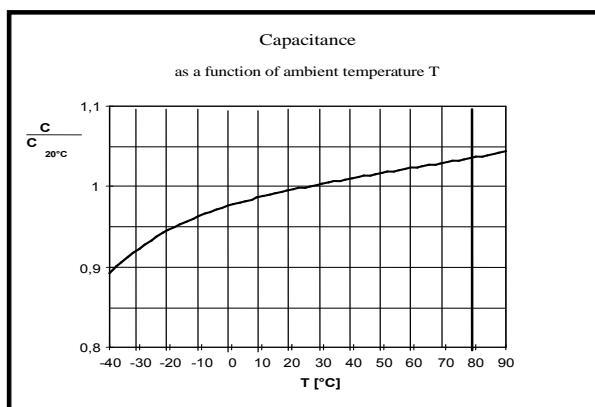

In most applications the capacitor is applied to an alternating voltage so in general the capacitance is measured with the AC method.

3.7 Capacitance vs temperature and frequency

The capacitance varies with temperature and frequency

- The capacitance increase with increasing temperature
- The capacitance decrease with increasing frequency

The following diagrams exhibit typical courses of these dependences

3.8 ESR

The equivalent series resistance represents the losses of a capacitor (the resistance of the foil, electrolyte, terminals). The ESR depends on frequency and temperature.

3.9 ESL

The equivalent series inductance represents the inductive part of the capacitor (leads, foil). The ESL depends mainly on the frequency.

3.10 Dissipation factor tan δ (DF)

The dissipation factor is defined as the power loss of the capacitor divided by the reactive power of the capacitor.

$$\tan \delta = \text{ESR} * \omega * C_s$$

In general the DF is measured at 100 Hz and 20 °C.

Equivalent circuit of an electrolytic capacitor
- simplified -

3.11 Impedance Z

The impedance of the capacitor is given by the ESR, ESL and the capacitance.

The impedance depends on the temperature and the frequency. The Impedance is normally measured at 10 kHz.

4. Mounting

Position for screw terminal capacitors

Upright position is recommended to prevent electrolyte leakage in case of vent opening.

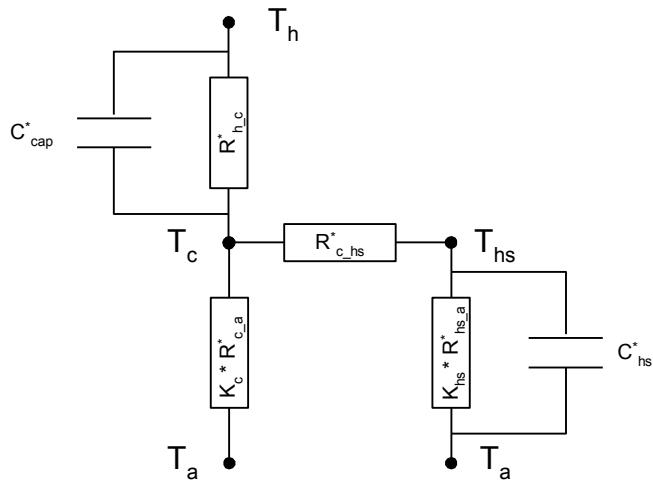

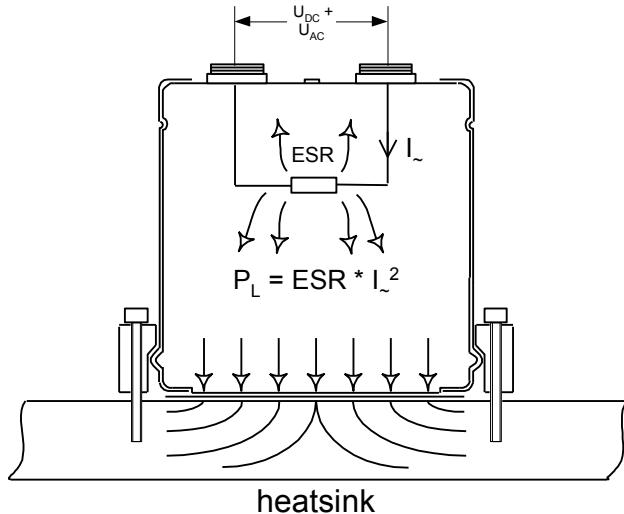

Horizontal mounting is also possible but the vent must faces upwards.

Terminals / Mounting stud

6. Quality

6.1 Certification

Quality is the main reason of our success. Without ignoring the importance of price of course, customers choose and remain with FTCap to satisfy their needs for top quality capacitors. It is therefore our pledge to continue producing and delivering top quality capacitors as efficiently as possible.

In addition to our commitment to quality, we are also committed to a healthy environment. That is why each and every one of our employees, from top management down to the workshop, accepts his or her environmental responsibilities and strives to work as effectively and efficiently as possible.

Intermediate testing is carried out through the entire production process in addition to the 100% final testing of each capacitor before shipment. All of our employees know that quality is the top priority for our customers. Workers participate in the process of continued improvement, quite often by anticipating. The result is uninterrupted flow production.

FTCap is certified according to DIN ISO 9001 : 2000. The company certificate is available on the [ftcap website](http://www.ftcap.de) www.ftcap.de.

7. Safety Precautions

7.1 Charged Capacitors

Electrolytic capacitors may store high amounts of energy (especially photo flash and high voltage capacitors).

To avoid electrical shocks and sparks always discharge electrolytic capacitors before handling.

For higher voltage it is recommended to shorten the terminals during handling.

7.2 Misapplication

Explosions of electrolytic capacitors may occur if the capacitor is exposed to

- reverse voltage above specified limit
- voltage above specified limit
- ripple currents above specified limit
- ambient temperatures above specified limit
- high mechanical impact

7.3 Operating electrolytes

Principally operating electrolytes used in FTCap products doesn't contain dangerous substances. However, in rare exceptional cases it is necessary to use certain substances to achieve certain physical chemical or electrical properties. In these cases the concentration is reduced to an absolute minimum.

Generally the following safety hints should be respected using operating electrolytes:

Avoid skin and eye contact.

With electrolyte moistened skin parts are to be cleaned immediately with sufficient flowing water.

Eyes must be rinsed at least 15 min under flowing cold water. Visit physician immediately with complaints.

Inhale from electrolyte steam or nebulas has to be avoided. Work area must be well ventilated.

Cloths which came into contact with electrolyte should be washed or cleaned.

7.4 ROHS

All FTCap products are full compliant with the RoHS Directive 2005/618/EC.

Our products are declared as „**RoHS compliant**“

and on the packaging label as "**According to RoHS**"

7.5 Disposal

Aluminium Electrolytic Capacitors can be disposed or recycled. The disposal rules are governed by the national and local authorities and had to be taken into consideration. The European Waste Code No. is 160214
